Please search the following:

1. SEQ ID NO:3-4.

2. oligo search of SEQ ID NO:3-4.

Please search both commercial and patent databases (including pending). Thanks

                                                                                                                                                                                                                                                                                                                                                          146
                                                                                                   Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and UI-R-El libraries. The UI-R-Al library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, and muscle. The UI-R-El library consisted of a mixture of individually tagged normalized libraries constructed from 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-CO) was constructed as follows: PCR amplified CDNA inserts from a pool of UI-R-Al and UI-R-El clones from which 3' ESTs had been derived was used as a driver in a hybridization with the pooled UI-R-Al and UI-R-El library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-CO library. This procedure has been previously described. PROMED ALL TERMS AND ALL TERM

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DB

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing credit recombinant host cell under conditions, where DNA is expressed.

Crahe nucleic acid encoding the chelon protein is useful for binding credit mercuric ions, to take up, sequester and concentrate the heavy metal ions from contaminated soil, ground water, hydroponic solutions or immobilised onto a solid support, is useful for concentrating heavy metal consistent mercuric particular to suseful for concentrating heavy metal consistent medium including biological fluids. The nucleic acid, when recombinantly expressed in enteric bacteria (which are nontoxigenic and compathogenic), is suitable for use in the in vivo sequestration and claimination of mercuric ion from gastrointestinal tracts of animals or molecules of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cration such as mercury or cadmium with high affinity. The present amino contented chalons of the invention is highly specific and binds divalent cald sequence represents the synthetic Merk chelon variant protein of the invention. This sequence is one of the heavy metal binding proteins contented chalons of the invention are dead in the protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        which binds mercuric ions. The invention is useful for recombinantly conducing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding cd divalent mercuric ions, to take up, sequester and concentrate the heavy metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when close from contaminated environment waste streams or contaminated aqueous medium including biological fluids. The nucleic acid, when recombinantly expressed in enteric bacteria (which are nontoxigenic and conpathogenic), is suitable for use in the in vivo sequestration and elimination of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The calid sequence represents one of a collection (AA097553-AA097560) of cold sequence is one of the heavy metal binding proteins of the invention. This sequence is one of the heavy metal binding proteins termed chelons of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

Comprising a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding comprising a promoter active in the host cell operably linked to a coding cregion for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding created ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when contaminated environment waste streams or contaminated contaminated environment waste strea

The invention is useful for broducing a protein in a host-cell, by infecting or transforming a host cell producing sequence with a vector comprising a promoter active in the host cell operably linked to a coding comprising a promoter active in the host cell operably linked to a coding comprising a promoter active in the host cell operably linked to a coding cregion for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed.

CC The nucleic acid encoding the chelon protein is useful for binding cometal ions from contaminated soil, ground water, hydroponic solutions or metal ions from contaminated soil, ground water, hydroponic solutions or contaminated environment waste streams or contaminated compact from contaminated environment waste streams or contaminated compact of the invention and content property is suitable for use in the in vivo sequestration and content property is suitable for use in the in vivo sequestration and content property is suitable for use in the in vivo sequestration and content property is suitable for use in the in vivo sequestration and content property is suitable for use in the in vivo sequestration and content property is suitable for use in the in vivo sequestration and content property is suitable for useful in water treatment resins.

CC molecules of the invention are also useful in water treatment resins.

CC molecules of the invention are also useful in water treatment resins.

CC molecules of the invention are also useful in water treatment resins.

CC molecules of the invention is highly specific and binds divalent among the property in the property of the invention is highly specific and binds divalent and content content content in the invention.

CC acid sequence represents one of a collection (AAU9753-AAU97560) of a fit is invention.

The present invention relates to a new non-naturally occurring CC recombinant DNA molecule comprising a sequence encoding a chelon protein CC which binds mercuric ions. The invention is useful for recombinantly CC which binds mercuric ions. The invention is useful for recombinantly CC which producing a protein in a host-cell, by infecting or transforming a host CC cell capable of expressing a chelon coding sequence with a vector CC cell capable of expressing a chelon coding sequence with a vector CC region for the protein to produce a recombinant host cell and culturing CC the recombinant host cell under conditions, where DNA is expressed.

CC The nucleic acid encoding the chelon protein is useful for binding CC metal ions from contaminated soil, ground water, hydroponic solutions or CC irrigation water of waste streams. The DNA of the invention, when CC irrigation water of waste streams. The DNA of the invention or CC irrigation water of waste streams. The DNA of the invention are associated any invention and concentrating heavy metal capable for useful for concentrating heavy metal CC auceous medium including biological fluids. The nucleic acid, when CC elimination of mercuric ion from gastrointestinal tracts of animals or CC elimination of mercuric ion from gastrointestinal tracts of animals or CC molecules of the invention are also useful in water treatment resins. CC cation such as mercury or cadmium with high affinity. The present amino CC acid sequence represents one of a collection (AAN97553-AAN97560) of CC This sequence is one of the heavy metal binding ordeins termed chalons.
                                                                                                                                                                                                                                      밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                YRX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                     of the invention
                                                                            This sequence is one of the heavy metal binding proteins termed chelons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a new non-naturally occurring recombinant DNA molecule comprising a sequence encoding a chelon protein which blinds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding the chelon protein is useful for binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 4; Page 22; 42pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel non-naturally occurring recombinant DNA molecule encoding a chelon protein useful for binding divalent cation mercury from contaminated soil, water, aqueous medium including biological fluids -

                                                                                                                                                                                                                                                                                                                       The nucleic acid encoding the chelon protein is useful for binding contained to take up, sequester and concentrate the heavy contained soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when contaminated environment waste streams or concentrating heavy metal ions from contaminated environment waste streams or contaminated concentrating heavy metal consumer including biological fluids. The nucleic acid, when compathogenic, is suitable for use in the in vivo sequestration and contamination of mercuric ion from gastrointestinal tracts of animals or contaminated contains exposed to toxic metal ions such as mercury and/or cadmium. The nucleic acid of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent contains contains contains contains a mercury one of a collection (AAU9753-AAU97560) of contains conta

cc which binds mercuric runs. The invention is useful for recombinantly protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding cregion for the protein to produce a recombinant host cell and culturing combinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding combinant mercuric ions, to take up, sequester and concentrate the heavy compared to the invention water of waste streams. The DNA of the invention, when crimpation water of waste streams. The DNA of the invention water contaminated soil, ground water, hydroponic solutions or contaminated environment waste streams or contaminated compathogenic), is suitable for useful fulds. The nucleic acid, when crecombinantly expressed in enteric bacteria (which are nontoxigenic and compathogenic), is suitable for use in the in vivo sequestration and compathogenic), is suitable for use in the in vivo sequestration and compathogenic), is suitable for use in the in value treatment resins. The nucleic acid of the invention are also useful in water treatment resins. The contains such as mercury and/or cadmium. The contains such as mercury and/or cadmium to cate in the invention and contains and contai

                                                                                                                                      CC which binds mercuric ions. The invention is useful for recombinantly cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. CC The nucleic acid encoding the chelon protein is useful for binding cd divalent mercuric ions, to take up, sequester and concentrate the heavy metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when combinantly expressed in enteric bacteria (which are nontoxigenic and compathogenic), is suitable for use in the in vivo sequestration and celimination of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The cation such as mercury or cadmium with high affinity. The present amino of a cation such as mercury or admium with high affinity. The present amino can an exposed to toxic metal ions such as finity. The present amino can are also useful affinity. The present amino can are also mercury wild-type metal and compathogenic and the invention are also useful in water treatment resins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 9

KXEKKEFFFKKKOOOOOOOOOOOOOOOOOOOOOOO
                                                                                                                                           C divalent mercuric ions, to take up, sequester and concentrate the heavy metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when c immobilised onto a solid support, is useful for concentrating heavy metal cons from contaminated environment waste streams or contaminated concentrating heavy metal consistency medalum including biological fluids. The nucleic acid, when crecombinantly expressed in enteric bacteria (which are nontoxigenic and compathogenic), is suitable for use in the in vivo sequestration and conpathogenic), is suitable for use in the in vivo sequestration and conpathogenic), is suitable for use in the invito sequestration and conpathogenic), is suitable for use in the invito sequestration and conpathogenic), is suitable for use in the invito acquisit of animals or compathogenic), is suitable for use in the inventory and/or cadmium. The model of the invention are also useful in water treatment resins.

CC molecules of the invention are also useful in water treatment resins.

CC The nucleic acid of the invention is highly specific and binds divalent contains such as mercury or cadmium with high affinity. The present amino acid sequence represents one of a collection (AAU97553-AAU97560) of avertheric cadmium/marcurv ion binding chalon professions of the invention is highly specific and binds divalent contains and the invention acid sequence represents one of a collection (AAU97553-AAU97560) of avertheric cadmium/marcurv ion binding chalon professions of the invention is highly specific and binds divalent contains and the invention acid sequence represents one of a collection (AAU97553-AAU97560) of avertheric cadmium/marcurv ion binding chalon professions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               recombinant DNA molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding the chelon protein the conditions.
                                                                     of the
                                                                                                  This sequence is one
                                                                                                                                synthetic cadmium/mercury ion binding chelon proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel non-naturally occurring recombinant DNA molecule encoding a chelon protein useful for binding divalent cation mercury from contaminated soil, water, aqueous medium including biological fluids -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a new non-naturally occurring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 4; Page 22; 42pp; English.

                                                                     Matches
                                                                                              Query Match
                                                                                                                                                                The present sequence represents a protein that is selective towards heavy metal ions. It is used in the construction of the sensor of the invention. The specification describes a metal ion-specific, affinity sensor that measures capacitance. The sensor comprises a piece of noble metal to which are bound groups that bind specifically to selected heavy metal ions. These groups are bound to a self-assembling monolayer that covers at least 90% more preferably at least 99% of the noble metal surface. The noble metal is a rod or piece of insulating material glass, quartz or silica) on which a noble metal is sputtered. The sensor is used for qualitative or quantitative detection of selected heavy metal ions in liquid samples, particularly of zinc, mercury, cadmium, copper and lead in e.g. environmental samples, medicines, foods and other readmire.

The invention relates to a method for displaying a polypeptide/protein on the control of the polypeptide/protein to a unit of the protein coat of the polypeptide/protein to a unit of the protein coat of the bacteriophage particle. The attachment is via a disulfide bond to the bacteriophage particle. The attachment is via a disulfide bond to the bacteriophage particle. The polypeptide/protein and a cysteine coat of the bacteriophage particle. A collection of the bacteriophage particles of a bacteriophage particle. A collection of the bacteriophage particles of useful for obtaining a polypeptide/protein having a desired property, by screening the collection and/or selecting from a bacteriophage complexing to a target of interest. The method further involves contacting conditions. The methods easy creation and bacteriophage to the target of interest to by treating the complexes of target of interest and bacteriophages under creducing conditions. The methods easy creation and screening of large bacteriophage particles with the target of interest conditions. The methods easy creation and screening of large bacteriophage particles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

CC polypeptide which regulates, causes or contributes to obesity in an CC animal or a human. The polynucleotides, proteins, ant-adp antibodies, CC modulators of adp activity, adp antisense nucleic acids, expression CC wectors, adp transgenic animals are useful in the diagnosis and CC treatment of obesity, adipositas, bulimia, wasting (cachexia), eating CC disorders and/or disorders of body weight/body mass, weight loss due to CC cancer or infectious diseases, genetic disorders associated with CC hypogonadism e.g. Prader-Willi syndrome, Laurence-Moon-Biedl syndrome, CC gastrointestinal diseases, inflammatory bowel disease, ulcerative CC colitis, and anorexia nervosa. They are also useful for treating CC disorders of body weight/mass e.g. glycogen storage diseases, and lipid CC compositions are also useful for treating heart disease, hypertension, CC and infertility and for treating conditions associated with under weight ce.g. enhancing or controlling fertility, controlling weight loss in CC acquired immunodeficiency syndrome (AIDS) or cancer patients. The CC present sequence is a peptide tag used in a fusion protein with an CC adap protein to facilitate purification
                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                 QΨ

                                                                                                                                                                                                                                                              AAW59211 and AAW59212 are ligands used in a method to assay binding affinity of streptavidin mutants. These mutants have a mutation within the amino acid (aa) region 44-53 of the wild-type protein show a higher binding affinity than the wild-type for peptide ligands that include the sequence of formula Trp-X-His-Pro-Gln-Phe-Y-Z where X = any aa; Y and Z are both Gly, or Y = Glu and Z = Arg or Lys. Recombinant streptavidin mutants can be used to isolate, purify and determine proteins or to determine/recover substances that contain streptavidin-binding groups. Such compounds may also be used to immobilise fusions on microtitre plates, microbeads or sensor chips.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Streptavidin mutants with higher binding affinity for peptide ligands - have mutation in amino acid region 44-53, used to isolate, purify or determine fusion proteins including these ligands
                                                                                                                                                                                                                               Sequence
